ABSTRACT

Α system (1)for collecting biological information on a dyed biological particle (cell 5 chromosome) by irradiating light onto liquid containing the dyed biological particles and for detecting information light therefrom is provided according to the present The system includes a path-defining structure invention. (2) of transparent material defining a flow path 10 through which the liquid containing the dyed biological particles irradiation runs, an apparatus (5) for irradiating light onto the particles passing through the flow path (3), a first detecting apparatus (21)for detecting first information light obtained from the 15 irradiated particle, and a second detecting apparatus (25) for detecting second information light obtained from the irradiated particle. At least one of the first and second detecting apparatuses (21, 25) includes one or more fiber optics (26, 27), of which one ends (61, 62) are arranged 20 adjacent the flow path (3) so as to collect the information light.
